WHOLE HOUSE WATER FILTERS SYSTEMS ARE AWESOME

How would you like to have crystal clear, wonderful tasting, water at each faucet and shower in your home?

It seems like the public street water taste and smells worse and worse as time goes on. Water can contain chlorine, fluoride, bacteria, viruses, pesticides, lead, nitrates, to name a few. Sometimes when you run the shower you get a strong odor of chlorine and chemicals. I'm not a scientist, but it seems to me that if chlorine is added to our water to kill the bad stuff, what is it doing to our bodies when we drink and wash with it? Every time you take a shower whatever contaminants are in the water get absorbed through your skin. It can't be good for you!

I personally have a whole house water filter system and love it. The water tastes like spring water. There is no chlorine taste or odor. The oils on your skin don't get dissolved from chemicals. With a whole house water conditioning system, all of the showers, tubs, faucets, water taps etc., deliver much better and safer water than what you get straight from the public water system.

As you would expect, you get what you pay for. There are simple cartridge filters that improve the water quality to an extent, and cost under \$400 installed. There are higher quality more effective water conditioning systems that cost upwards of \$4,500. Again, you get what you pay for.

We recommend that you do your research and talk to some of the companies that sell and install water filter systems and take it all into consideration and see if one of these systems is right for you.
